

PM Internship Project Brief

Seat Booking Web Application

Context

You are the Product Manager for a new coworking space seat booking website. A company wants to launch a platform where users can browse available workspaces, book desks or rooms, and manage their reservations.

That's the starting point — everything else is up to you to define.

This project is your opportunity to apply everything covered during the internship. Treat it as a real product launch: research the space, make decisions, justify them, and present a plan you'd stand behind in front of stakeholders.

What You Need to Deliver

- **Product Vision & Vision Statement** — What is this product and why does it matter? Who is it for?
- **User Research & Competitive Analysis** — Understand the market, existing solutions, and your target users. Desk research is fine.
- **User Personas** — Who are you building for?
- **Sprint plan** - with team and capacity assumptions
- **Prioritized Feature Backlog** — A list of features with titles, short descriptions, and a clear prioritization rationale. Why these? Why this order?
- **5–8 Fully Written User Stories** — With acceptance criteria. Pick stories that represent your most important flows.
- **Wireframes** — Cover the core user flows. Use whatever tool you're comfortable with (Figma, Miro, Balsamiq, pen and paper — your call).
- **Success Metrics & KPIs** — How would you measure whether this product is working? Tie metrics to your product goals.
- **Product Roadmap** — How does this product evolve? Format is your choice.
- **AI Usage Documentation** — For each deliverable, start by doing the work manually first. Then use AI to refine, improve, or expand it. Document the process: show us your original manual version, what AI tools/prompts you used, and the updated version. We want to see your thinking *and* how you leveraged AI to make it better.
- **Final Presentation & Demo** — Walk the PM through your product, your decisions, and your plan. This is your product launch moment.

Nice to Have — Go Beyond

These aren't required, but strong projects usually include some of these:

- Full backlog with detailed user stories beyond the required 5-8
- Clickable prototype instead of static wireframes
- Go-to-market or launch plan
- OKRs
- Anything else you think strengthens your product case

How You'll Be Evaluated

A senior PM from FTS will be assigned to each of you to review your final presentation. They'll be looking at:

- **Organization** — Is your work structured, clear, and easy to follow and did you follow the agreed time limit (20 minutes total)?
- **Presentation** — Can you tell a compelling product story?
- **Decision-Making** — Do your choices make sense? Can you defend them?
- **Completeness** — Did you miss anything important?
- **AI Usage** — Did you use AI effectively and thoughtfully?
- **Knowledge from Self Study Materials** — Can you answer a couple questions related to the materials you studied earlier in the internship?

Logistics

- **Duration:** 2 weeks
 - **Solo project** — this is individual work
 - **Language** — the presentation and materials should be in English
 - **Weekly check-ins** with a senior PM — come ready to talk about where you are, what you're thinking through, and where you need input
 - **Final presentation** at the end of week 2
-

There's no single right answer here. Two people can make very different product decisions and both be right — if the reasoning is solid. Don't try to cover everything. Make deliberate choices and own them.

AI is a tool in your toolkit — use it. But the thinking comes first. If you can't explain a decision without looking at your notes, you didn't do the work. The evaluating PM will know the difference.
