

Sit: AI usage log and design decisions

Seat booking web app · PM internship project · Tala Kherawish · October 2026

Contents

1. [AI Usage Log](#)
2. [Design decisions: manual version](#) (my own review notes)
3. [Design decisions: AI-refined version](#)

AI Usage Log

For each deliverable: manual version → AI tool + prompt → refined version → what changed and why I kept or rejected it.

#	Deliverable	Manual version	AI tool	Prompt(s)	Refined version	What changed / what I rejected
1	Vision & statement	01-vision/manual/			01-vision/ai-refined/	
2	Research & competitive analysis	02-research/manual/			02-research/ai-refined/	
3	Personas	03-personas/manual/			03-personas/ai-refined/	
4	Prioritized backlog	04-backlog/manual/			04-backlog/ai-refined/	
5	User stories (5–8)	05-user-stories/manual/			05-user-stories/ai-refined/	
6	Sprint plan	06-sprint-plan/manual/			06-sprint-plan/ai-refined/	
7	Wireframes	My own review notes on the clickable prototype (Design decisions: manual version , below). No separate hand sketches.	Claude Code (Claude Opus 5.5)	7 prompts, word for word in 7. Wireframes below	07-wireframes/ai-refined/wireframes.html (live: https://talakherawish.github.io/sit/wireframes/) and screens/ (27 PNGs)	Five versions in one day. Kept: low-fi frames traced from the prototype, tap counts, notes tied to UX laws, one flow per page. Rejected: short notes, the by-date booking form, the "Every screen" page. Details below.
8	Metrics & KPIs	08-metrics/manual/			08-metrics/ai-refined/	
9	Roadmap	09-roadmap/manual/			09-roadmap/ai-refined/	
10	Presentation	10-presentation/manual/			10-presentation/ai-refined/	

7. Wireframes

Starting point. I didn't sketch the wireframes by hand. The manual input was my own review of the clickable prototype, round by round ([Design decisions: manual version](#), below), and the UX resources summary from the self-study material. The AI traced the wireframes from the prototype and applied the resources' advice on wireframing.

Tool. Claude Code (Claude Opus 5.5), working in this repo. It read the prototype's code and screens, wrote the page, rendered the screen images and pushed to GitHub Pages.

Prompts (word for word, except 3)

1. "create wireframes for the demo we just built following resources advice on wireframes" (with the UX resources summary pasted in)
2. "do u think we should add this to the repo and have it deployed with therest?", then "do it and push"
3. In another chat, after the Next/Later features were cut from the prototype, the wireframes were matched to it and the notes shortened (that prompt isn't recorded here)
4. Asked whether to bring the notes back: "Bring them back"; then "update the wireframes accordingly and send them to me as screenshots or pictures of the screens only"
5. "also make the wireframes html page more interesting to read and keep reading because it is a bit annoyingly long"
6. "add notifications back so renters get alerted also add u in code and in the side by side demo and in every copy"
7. "remove the screens section <https://talakherawish.github.io/sit/wireframes/#screens> its fugly and unnecessary only keep necessary stuff"

Versions, and what I kept or rejected

Version	What the AI produced or changed	What I kept, rejected or asked for, and why
1	One long page: greyscale low-fi frames for 6 flows (25 frames) traced from the prototype, taps counted on every arrow, pink pins with notes naming the UX law, a key, a navigation map, a principles index and a test plan. Published at /wireframes/.	Kept the approach: structure only, no colour or branding, so the review stays on "does the flow work?" (the resources' definition of a wireframe). Kept the tap counts ("clicks to treasure").
2	(Another chat) Matched to a trimmed prototype: dropped login, reports, notifications and the by-date booking form; added the Rooms tab day view; shortened the notes to one line.	Rejected the short notes: they were what tied each choice to the UX resources. Reporting and notifications had been removed by mistake, so I had them restored in the app. The by-date form stayed out because it's gone from the prototype.
3	Report flow back (renter form, My reports, the staff inbox, the reply reaching the renter). Full notes back. The page became one flow at a time: overview cards with tap counts, a sticky bar of flows, Next/Back, arrow keys, and pins that highlight their note. Every screen exported as its own PNG.	Asked for the paged layout because the long page was tiring to read. Asked for the PNGs so the screens can go on slides without page text.
4	Alerts: a bell with an unread dot on every renter screen, an alert banner, and Notifications (R-18) in Flow 6. Added to the app and the side-by-side demo too.	Asked for it: without alerts, a renter only saw a reply to their report if they happened to open My reports.
5	Removed the "Every screen" page (the tab and sidebar map).	Rejected it: it looked messy and the flows already show every screen.

Design decisions: manual version

These are my own review notes, written while I tested each version of the prototype. They're copied word for word from what I asked for (spoken or typed quickly, so spelling is left as it was). Nothing here was rewritten by AI.

The AI-refined version, which maps each decision to a UX principle, is further down this file ([Design decisions: AI-refined version](#)).

Under each round: **What I said** is my original note. **Why** and **Principle** are for me to fill in, in my own words.

Round 1: Look and feel

What I said

make it more elegant like apple iphone

minimal yet creatively formatted

white background better color palettes, make the floor map more architectually nice. use fots like the google one or iphone avoid AI looking ui. make everything clickable as if it was a real person with everything setup

Why I asked for this:

Principle I was following:

Round 2: Staff dashboard, cafeteria, booking several days

What I said

make the staff dashboard look like this too / its cafeteria not kitchen and add it to the list of ammenities when open and stuff, when wanting to book not only show hours available today and also show a calendar like ption for choosing mutiple days a month or week

Why I asked for this:

Principle I was following:

Round 3: First full review of the renter app

What I said

Starting with the name, it always has to be Tala. The user, the, the person using it, actually. And then I don't think there's a need for Thursday first of October, like the actual date. What's R01? I don't get it. Right below good morning, Muhammad. I like the live public seating. It's my favorite so far. The Wi-Fi thing, I was thinking of writing the actual speed. From the normal speed test. What's the second part about how do you want to work? And when we click on stuff, for example, let's say when I click on today now, UI breaks. It stays up and I can scroll below it. Notifications are off. I actually realize it's all of them. All of the things that can drop and drag from below. They don't look neat.

Why I asked for this:

Principle I was following:

Round 4: Second review: branding, booking flow, Home layout

What I said

remove the prototype tag remove sit and the chair and use technoparks logo instead. When we click on a room and it shows free slots, instead of showing all the free slots, I needed to show all the, the entire opening time with obvious indicators of from what hour to what hour it's booked. We can change uh, the way time shows here. Um, also, when we click on a room to book it, the notification of, or the option to book is, is just not, it doesn't show when it, where it should. It's broken, it's way up in the scrolling section. For some reasons, I don't like rooms today. It looks really crowded, it's not saying anything. Remove the coming soon. Where it says zone rules, oh yeah, you click and it's way up too. It doesn't show from the bottom of where you clicked. Show it as a card, I think it's better. Or make it come from the bottom of the screen up. That's perfect. Where it says free booked matches and down, the indicators to show what the symbols mean, they should all be on the same line. So maybe instead of matches selected, choose one, the one that applies best. Remove the plus and minus and reset to zoom in and zoom out. And um, the floor plan can stay still. I think it's better that way. When booking, in order to get to the calendar and choosing multiple days, um, it's really annoying. You have to go through a lot of clicks to get to the calendar part. Also, like while picking time slots, sometimes it doesn't let you and removes your previous selection. So how does that work? Because I personally don't get it. And I would like the colors to be more What's the word? Like organized together or going along together better. When it when I go to my bookings and I have something booked for in the future, it says change and cancel. It doesn't say confirm. And obviously The most recent one should be the one on top. With sorting options, of course. I feel like in the good morning screen, we can keep the what are you here to do for further down scrolling. You know, not everything has to be stacked up on top of each other. And yeah, just try to have sectioning really nicely put. I don't get the list. Like spaces, is this how you book not from the map?

Why I asked for this:

Principle I was following:

Round 5: Staff dashboard and the UX resources

What I said

make the staff dashboard match these changes too
here are the ux resources summarized do u think were going against any? do u think theres something valuable ere we could adopt?

Why I asked for this:

Principle I was following:

Round 6: Home-screen icon, repeating bookings, fixes from the resources

What I said

make the echnopark logo be the web app logo ifi wanna make it into a shortcup on my phone.
where it says find a room and we choose the date we should also be able to choose multiple days a week and month repetitions, or maybe a few days a month not necessarily the same week day. do all the fixes from the resources bigger timeline, Undo, shorter booking and make sure u have these updates somewhere so for my presentation i say whyi chose to do these things and what im following

Why I asked for this:

Principle I was following:

What I'd test next (my own plan)

-
-
-

Design decisions: what changed, why, and which principle it follows

Prototype: <https://talakherawish.github.io/sit/> (renter app) · <https://talakherawish.github.io/sit/s/today> (reception dashboard)

Presenting: <https://talakherawish.github.io/sit/demo> shows the renter phone and the reception dashboard side by side, sharing live data (check someone in on the right, watch the seat count change on the left).

We worked in **Design Thinking loops**: build from the spec, review it as a user, fix, repeat. Each round below lists what changed, the problem behind it, and the UX principle it follows.

Round 1: Build from the spec (Define → Prototype)

Decision	Why	Principle
Build a clickable prototype with fake data in the browser, not static screens	Lets people <i>use</i> the flow (book, get reminded, check in) instead of imagining it	Prototype → Test; "test instead of assuming"
Arabic and English with full right-to-left layout	Technopark renters use both languages	Accessibility; designing for the user's context
One booking sheet used by both the map and the list	Same task should work the same way wherever you start	Consistency

Round 2: Look and feel

Decision	Why	Principle
iPhone-style patterns: large titles, grouped lists, bottom sheets, tab bar	People already know how these work on their phones	Jakob's Law
White background, one card colour, system fonts	Calm, readable, less "AI-looking" decoration	Aesthetic-Usability Effect ; clarity > decoration
Architectural floor plan (walls, doors, one dot per seat)	Renters recognise the real building, so they find rooms faster	Familiar mental model; context

Round 3: First review (Empathize → Define)

Decision	Why	Principle
The signed-in user is always Tala	The prototype should feel like <i>your</i> account	User-centred design
Removed the date line and the "R-01" screen codes	Didn't help the user; added noise at the top	Reduce cognitive load; Miller's Law
Wi-Fi row shows the real speed (↓ 94 · ↑ 41 Mbps) with a speed-test panel	"Wi-Fi back to normal" doesn't tell you if you can take a video call	Useful information over vague status
"How do you want to work?" became "What are you here to do?" with a one-line explanation	Users didn't understand what the chips did	Clear labels; feedback
Pop-ups became true bottom sheets that cover the screen, drag down to close	They opened off-screen and the page scrolled behind them	Fitts's Law (actions near the thumb); feedback; familiar pattern

Decision	Why	Principle
Notifications grouped into "New" and "Earlier", each with an icon and an action	A flat list didn't show what mattered	Visual hierarchy

Round 4: Second review

Decision	Why	Principle
Technopark Palestine logo; colours taken from it (navy for actions, teal for "free", red only for alerts)	Mixed orange/navy/teal felt disconnected	Consistency; Von Restorff (one strong colour for the main action)
Hid the reviewer "Prototype" tab (open it by tapping the logo 3×)	It looked like part of the product	Clarity > decoration
Room sheet shows the whole opening day as a timeline with labelled "Booked 10:00–11:00" blocks	A list of free start times hid <i>when</i> the room was taken	Visibility of system status; error prevention
Clear time selection: tap to start, tap again to stretch, tap inside to shorten, and a message if a booking is in the way	Picking times sometimes silently reset your choice	Feedback after actions; prevent errors
"Book more days" switch in the room sheet with a calendar	Reaching multi-day booking took too many taps	Fewer clicks to the main value ("clicks to treasure")
Floor plan no longer zooms; removed –, + and Reset	Extra controls with little benefit	Hick's Law (fewer choices)
Map key on one line: Free · Booked · Selected · Down	"Matches / selected" was confusing and wrapped onto two lines	Miller's Law; consistency
Removed "Rooms today" and "Coming soon" from Home	Crowded, said little	Avoid too much information
Home split into clear sections: status → floor plan → "What are you here to do?" (which now lists suitable rooms)	Everything was stacked at the top	Visual hierarchy; chunking
My bookings: Confirm button next to Change / Cancel, plus sort options	Confirm was missing; newest wasn't on top	Make important actions obvious; user control
"List" tab renamed Rooms with a one-line explanation	Users didn't know the list was another way to book	Clear navigation

Round 5: Reception dashboard matches the app

Decision	Why	Principle
Same logo, colours, live seat card and notice rows as the renter app	Staff and renters should see one product	Consistency
"Rooms today" timeline for all rooms: bookings coloured by state, a line for "now"	Reception sees the whole day at a glance	Visibility of system status
Click a booking to check in; click free time to book for someone (form pre-filled)	Fewer steps for the most common desk tasks	Fewer clicks
Sort today's bookings by time, room, renter or status	Different questions at the desk need different orders	User control and freedom

Round 6: Checked against the UX resources

Decision	Why	Principle
Timeline rows are 44 px tall (was 30 px); past hours are hidden today	30 px was below Apple's 44 px minimum tap size, so it was easy to miss	Fitts's Law ; accessibility
Undo on the confirmation message after booking or cancelling	A cancel was final; a mistaken booking had to be cancelled by hand	Let users recover from mistakes
Shorter booking : when you've already picked room and time, the next screen is a one-page review (summary + "What's it for?" + Confirm)	The full form asked again for what you'd already chosen	Clicks to treasure; Hick's Law
Find a room supports One day, Weekly (e.g. every Sun & Tue for 4 weeks), Monthly (e.g. the 1st of each month) and Pick days (any days, not the same weekday)	Regular renters book patterns, not single days	Understand user needs; flexibility
Find a room shows results instantly ("Free on all 7 days" / "Free on 6 of 7") and books straight from the result	The old "Show rooms" button was an extra step	Feedback; fewer clicks
Technopark icon when you add the site to your phone's home screen (web app manifest + Apple touch icon)	Renters open it like an app	Jakob's Law; mobile context
A clear ending: confirmation screen plus "Booked · Undo"	People remember the end of a task most	Peak-End Rule

Round 7: Logic fixes on the reception dashboard

Decision	Why	Principle
Check-in only counts a booking when it's due (30 min before start until it ends); earlier arrivals are walk-ins until then, with a "Move to room" button when it comes due	Checking someone in at 09:30 marked their 15:00 booking as already used	Prevent errors; match the real-world process
Only walk-ins take a public seat; people with a room booking don't change the open-area count, and a walk-in moving into their room frees their seat	The seat counter went up for people going to private rooms	Accurate system status
No check-in when public seating is full (button says so)	The counter silently stopped at 40	Prevent errors; feedback
A person can't be booked into two rooms at the same time; the form warns before you submit and clashing days are skipped	Staff could double-book someone	Error prevention over error messages
Clear messages when nothing could be booked, instead of a silent "booked"	Staff thought a booking went through when it didn't	Feedback after every action
Reports can tick several issue types (e.g. AC and noise)	Real problems often come together	Match user needs; reduce extra reports
Staff and renter tabs share the same live data	A check-in on the dashboard didn't appear in the app	Consistency; visibility of system status

Round 8: First screen, booking without the map, flexible multi-day plans

Decision	Why	Principle
Home's first screen shows only the greeting, today's updates and a Book a room button; the floor plan starts below the fold	The floor plan title peeking at the bottom made the first screen feel busy	Visual hierarchy; Miller's Law (one idea per screen)
Book a room button at the bottom of the first screen	Some people want to book by date, not by exploring the map	Fitts's Law (thumb zone); Von Restorff (the one filled button); clicks to treasure
Book a room is a numbered flow: 1 Days → 2 Time → 3 Size → 4 Pick a room / Your days	Makes the steps obvious and the end in sight	Clear structure; reduce cognitive load
Removed the Monthly option	"Pick days" already covers any days in any month	Hick's Law (fewer, non-overlapping choices)
Several days become a day-by-day plan : each day has its own time and room, starting from the same room wherever it's free	Real schedules aren't identical every week; a busy room one day shouldn't block the whole booking	Flexibility and user control; error prevention
The suggested time skips times you're already booked	The first suggestion used to clash with Tala's daily 09:00 booking	Prevent errors
Review shows one card when every day is the same, or a day-by-day list when rooms or times differ	People should see exactly what they're about to book	Visibility of system status
Arabic spellings of everyone's names when the app is in Arabic (فاطمة، لين عنبتاوي، تالا خريوش، الكيلاني، شهد ملاح، أحمد سلامة، رنا)	Names in Latin letters looked out of place in the Arabic interface	Localization; consistency

Round 9: All rooms' day on the phone

Decision	Why	Principle
Rooms page opens on a Day view : hours down the side, one column per room, bookings as blocks, a line and time pill for now, in the style of Apple Calendar's day view	The reception timeline showed the whole day well but only fits a desktop; renters need the same overview on a phone	Jakob's Law (a pattern people know from their calendar app); mobile-first
Room names stay pinned at the top while the hours scroll	Columns are meaningless once you lose the header	Visibility; reduce memory load
Today starts at the current hour; past time is shaded	Nobody books the past, so the screen shows what's still useful	Hick's Law; relevance
Tap free time and that room's sheet opens with the day and time already picked	One tap from "I see a gap" to "I'm booking it"	Clicks to treasure; Fitts's Law
Narrow columns show stacked times with a lock icon instead of the word "Booked"	The word was cut off in 60 px columns	Clarity over decoration; colour is never the only signal
List view is kept one tap away (Day view / List)	Some people prefer a list of rooms with features	User control and freedom

Round 10: Reports and alerts back

Decision	Why	Principle
Report is the fourth tab again: report several issues at once, then follow each report's status and the staff reply in My reports	Removing it left renters no way to flag a broken AC or bad Wi-Fi, and reception no way to answer	Match user needs; visibility of system status
Reception gets a Reports inbox with a count in the sidebar and a "new reports" card on Today	A report nobody sees is worse than no report	Visibility of system status
Renters are alerted : a banner drops in as soon as something changes for them (a report update, a reminder, a released booking), and the bell keeps a red dot until they open Notifications	Without it, a reply only showed up if the renter happened to open My reports	Feedback after every action; recognition over recall
Notifications are grouped into New and Earlier , each with an icon and the one action it needs	Same reason as Round 3: a flat list didn't show what mattered	Visual hierarchy

Round 11: Everyone in one place

Decision	Why	Principle
Reception gets a People page: every renter account and every visit (who came, when, where, booked or walk-in), with people inside now at the top	Staff could only find someone by searching on Check-in, and had no record of who had been in	Visibility of system status; recognition over recall
One search box filters both lists, and clicking a row opens that person on Check-in	Staff look people up by name or phone, then usually act on them	Consistency; fewer steps
The page says plainly that people counted with + / – are not listed	The open-area count and the visitor list would otherwise look like they disagree	Honest system status
The Time & scenarios button is hidden in the side-by-side demo for now; the panel still opens with Ctrl + .	We want to rework it before showing it in the demo	Minimalist design

Clicks to book (roughly)

Task	Before	Now
Book one room, one time	Room → time → Book → choose reason (dropdown) → check end time → Book (about 7–8 taps)	Room → start → end → Book → reason chip → Confirm (about 5–6; 4–5 if you picked an activity first)
Book the same time on 3 days	Above + scroll the form to the calendar + tap 2 days	Room → start → end → "Book more days" → tap 2 days → Book → Confirm
Find a room every Sunday for a month	Not possible	Find a room → Weekly → pick Sunday → Book

What we have *not* done yet (and should)

- **Test with real users.** Every change so far came from our own review. Next step: 5 people (3 renters, 2 reception staff), three tasks each: *find a free room now*, *book the same room on two days*, *cancel one booking*. Watch where they hesitate; count taps; ask what they expected. The Prototype panel's Analytics tab (P-04) already logs some app events.
- **Wireframes** for the report (the `07-wireframes` folder) can be traced from the prototype screens.

Principles we follow (quick reference)

- **Jakob's Law:** familiar phone patterns (tab bar, bottom sheets, large titles).
- **Fitts's Law:** 44 px tap targets; main actions at the bottom near the thumb.
- **Hick's Law:** fewer controls (no zoom buttons, one-page review).
- **Miller's Law:** information in small groups (status card, sections, one-line key).
- **Von Restorff Effect:** only the main action is filled navy.
- **Peak-End Rule:** clear confirmation with Undo.
- **Aesthetic-Usability Effect:** calm, consistent visuals make it feel easier.
- **Product principles:** feedback after every action, prevent errors, allow recovery, consistency, accessibility (labels, not colour alone; Arabic RTL).
